

## NON-DIABETIC RETINOPATHY

*The following are important documentation tips and strategies for this disease/condition as required by the specificity needed in ICD-10:*

- Identify the presence or absence of a retinal break with retinal detachments.
- Specify if the break is a single, multiple, giant retinal tear, or retinal dialysis.
- Clarify the type of detachment such as a total, serous, or traction.
- Detail retinal breaks without detachment as being a horseshoe tear, a round hole, or multiple defects.
- Indicate the stage of retinopathy of prematurity.
- List any related or underlying conditions (e.g., hypertension).
- State the laterality (i.e., right, left, or bilateral).
