

**What is Carequality?**

Carequality is a public-private, multi-stakeholder collaborative that has come together to meet this challenge. The Carequality community is drawn from all parts of the healthcare ecosystem and it uses a consensus-based process to develop the tools to enable seamless connectivity across all participating networks. The NextGen Share interface to the Surescripts NRLS is built upon the Carequality Framework and both NextGen and Surescripts are Carequality Implementers.

**What if you had a cell phone plan that only allowed you to call other customers on your carrier? That's the situation for most healthcare providers today, when they join a data sharing network.**

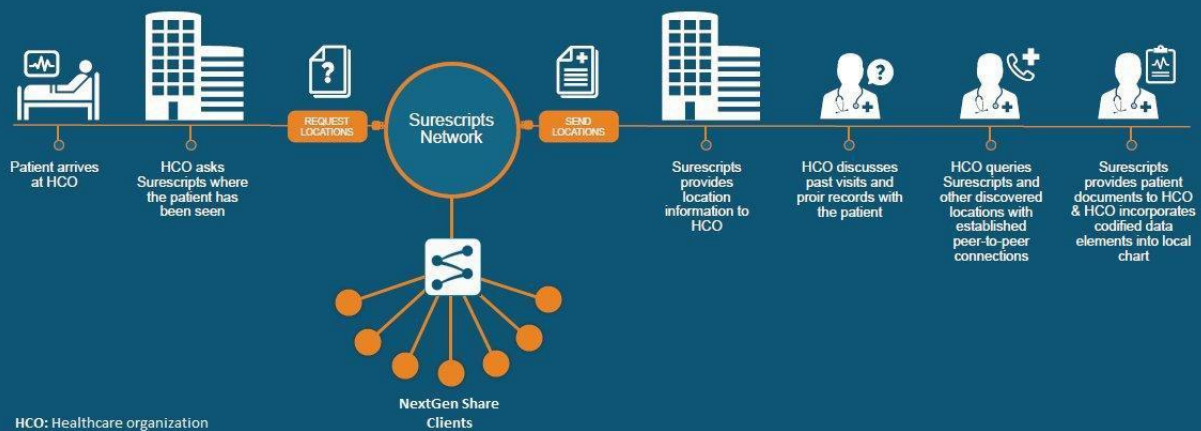

**What are the benefits?**

Leveraging the NextGen Share interface to the Surescripts NRLS allows clients to exchange patient location and clinical records with healthcare organizations in their community or across the country.

**How does it work?**

Providers and organizations on the Surescripts NRLS will be able to discover patients and retrieve data from other participants on the network. When your system is connected to the NRLS, external providers will be able to retrieve documents for patients treated at your practice, and, when you update to the 5.9/8.4 release of NextGen, you will be able to query the NRLS and retrieve documents from other participants.
